1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended as follows: please replace the old abstract with this abstract.

A method for use in the fabrication of active plates for pixilated devices, such as active matrix liquid crystal displays, having pixel electrodes (38) and associated address lines (32) formed from a layer of transparent conductive material (53) through which the conductivity of the address lines is improved. The transparent conductive layer (53) and a metal layer (54) are deposited in succession and followed by a shielding layer (60), e.g. of photoresist, which is patterned into a configuration of regions (67,68,69) corresponding to the required pixel dielectrodes and address lines with a property of the layer at these respective regions being different. This enables the regions of this layer corresponding to the pixel electrodes to be selectively etched away, thereby allowing the metal at these regions to be selectively removed while leaving metal at the address lines. The method simplifies the production of low mask mount TFT active plates with improved address line conductivity. Figures. 5I, 6.
